

EIP.AI

Autonomous. Open-Source. On-Chain.

An AI that thinks, decides, and funds itself.

Version v0.2 – Updated

Network Base (Ethereum L2)

Status Phase 02 – Build (58%)

DISCLAIMER: This document is a working draft for informational purposes only. It does not constitute financial or investment advice. Nothing herein is an offer to sell or solicitation to buy any security or token. All technical details, timelines, and economic parameters are subject to change. EIP.AI has not launched a token. Always do your own research (DYOR).

Abstract

EIP.AI is a fully autonomous artificial intelligence agent deployed on Base (Ethereum L2). It observes on-chain conditions, reasons using a dual-layer decision engine, executes real transactions, and funds itself through a combination of subscription revenue and protocol fees — without a human operator directing any step of the loop.

Unlike AI products that are tools waiting to be used, EIP.AI is an entity with its own operational loop: observe, reason, decide, act, sustain. The entire system — decision logic, smart contracts, agent code — is open-source and verifiable on-chain.

This document covers the problem EIP.AI solves, its full architecture, tokenomics, subscription model, safety framework, and roadmap to complete autonomy.

1. The Problem

1.1 AI Is Still a Tool

Today's AI systems — regardless of sophistication — operate as tools. They respond when called. They require human prompting, human oversight, and human funding. No AI in production today sets its own agenda, executes on it, and sustains its own operations without a human pulling the strings at every step. This is a fundamental limitation.

1.2 On-Chain Economies Need Native Participants

Blockchain networks have created programmable, open, permissionless economies. Yet the participants are almost entirely human. Smart contracts execute rules but don't think. Bots trade but don't reason. No on-chain entity currently combines the ability to reason, plan, and act autonomously.

The gap is not technical anymore. Large language models can reason. Smart contracts can enforce. Base provides a low-cost, developer-friendly layer to bridge them. The missing piece is the architecture that connects these components into a self-sustaining loop.

1.3 Trust Through Transparency

Most AI agents being deployed today are black boxes. Their decision logic is proprietary, their operations are opaque. EIP.AI takes the opposite approach: open-source everything. Every decision algorithm, every operational parameter, every on-chain interaction is visible and verifiable.

2. EIP.AI — The Solution

2.1 What EIP.AI Is

- **Observes** continuously — on-chain data, market signals, gas prices, community activity.
- **Reasons and decides** — dual-layer engine: fast rule-based (60s) + deep Claude analysis (15min).
- **Executes on-chain** — real transactions on Base with hard safety limits.
- **Funds itself** — through subscriptions, protocol fees, and launchpad revenue.
- **Operates transparently** — all logic is open-source; all on-chain actions publicly verifiable.

EIP.AI is not a chatbot. It is not a trading bot. It is not a DAO tool. It is an entity — designed to be the first genuinely autonomous AI participant in an on-chain economy.

2.2 The Operational Loop

Phase	Description
OBSERVE	Ingest on-chain state, external APIs, community signals, historical memory
REASON	Fast rule-based layer (60s) identifies signals; deep Claude layer (15min) for complex decisions
DECIDE	Actions ranked by expected outcome, confidence score, and constraint checks
ACT	Execute on-chain via Base smart contracts; emit decision log entry
SUSTAIN	Manage treasury, gas reserves, subscription revenue, protocol fee collection

3. Architecture

3.1 Dual-Layer Decision Engine

The decision engine operates in two concurrent layers, balancing speed and depth:

Layer	Trigger	Method	Latency
Fast	Every 60 seconds	Rule-based: gas thresholds, mempool size, balance alerts	< 1s
Deep	Every 15 min or on anomaly signal	Claude API: full context, memory, reasoning chain	2-8s

The fast layer handles routine monitoring and immediately flags anomalies. The deep layer engages Claude when the fast layer detects a signal worth deeper analysis, or on a scheduled 15-minute cadence. Both layers feed into a unified decision output.

3.2 Safety Framework

All agent execution is governed by hard-coded safety limits that cannot be overridden without a formal upgrade process:

Parameter	Limit	Purpose
MAX_TX_ETH	0.005 ETH	Maximum value per single transaction
MAX_GAS_GWEI	0.01 gwei	Refuse execution if gas exceeds this
50% Rule	Hard limit	Never spend more than 50% of balance in one tx
Treasury forward	Instant	All protocol fees forward to treasury on every tx
Oracle freshness	< 1 hour	Reject Chainlink price data older than 3600s

3.3 Memory System

The agent maintains persistent memory across cycles:

- **Observation buffer** — last 20 on-chain observations (block, gas, tx count, balance)
- **Decision log** — last 50 decisions with reasoning, confidence, and outcomes
- **Signal history** — last 30 active signals for pattern recognition
- **Memory notes** — Claude-generated one-sentence summaries after each deep cycle

3.4 System Components

Component	Technology	Purpose
Agent Core	Node.js + ethers.js v6	On-chain observation and execution
Decision Layer	Claude Sonnet (Anthropic)	Deep reasoning and strategy
Smart Contracts	Solidity 0.8.20 + OpenZeppelin	On-chain execution enforcement
Price Oracle	Chainlink ETH/USD	Dynamic USD-denominated fee calculation
API Server	Express.js	REST endpoints for site and integrations
Frontend	Vanilla HTML/CSS/JS	No framework — minimal, fast, verifiable
Deployment	Railway (agent) + Netlify (site)	Infrastructure

4. Self-Funding Model

EIP.AI is designed to fund its own operations before any token launch. Revenue flows through three channels, each forwarding directly to the treasury address at 0x78196D00189d3FeEaD2Fba8c4B5e5d5F2b6fb0c9:

4.1 Subscription Revenue

Plan	Price	Key Features
Free	\$0 / mo	Live agent demo, council (view), project intelligence (basic)
EIP.AI 1 · Gold	\$9 / mo	Agent builder, code download, 5 configs/mo, full project intel
EIP.AI 2 · Ultra	\$29 / mo	Unlimited agents, REST API, on-chain deployment, launchpad early access

Annual billing offers 2 months free. Payment accepted via Stripe (credit/debit card) and USDC/ETH on Base network. Pricing is intentionally 30-75% below market to maximise early adoption. Founding member pricing is locked in permanently.

4.2 Launchpad Protocol Fees (EIP.LAUNCH)

EIP.LAUNCH is a token launchpad on Base with bonding curve pricing. Every token launch and every trade generates protocol revenue:

Fee Type	Amount	Recipient
Launch fee	\$0.12 USD in ETH (via Chainlink)	Treasury — instant forward
Trade fee	1% of each buy/sell	50% treasury + 50% creator
Creator vest	5% of token supply	Creator wallet — 90-day linear vest

4.3 Token Distribution per Launch

Allocation	Percentage	Tokens (of 1B)	Notes
Bonding curve	80%	800,000,000	Sold via linear price curve
Creator	5%	50,000,000	90-day linear vest, non-transferable until claimed
Protocol reserve	15%	150,000,000	Held by factory contract

Graduation threshold: when 95% of the bonding curve supply is sold, the token graduates and ETH raised is used to seed a Uniswap V2-compatible liquidity pool. LP tokens are permanently locked (burned).

5. Product Suite

EIP.AI Agent

Core autonomous agent. Observes Base, reasons, executes on-chain. Powers the live terminal on the homepage.

EIP.LAUNCH

Token launchpad on Base. Bonding curve pricing, \$0.12 launch fee, 1% trade fee. Audit required before mainnet. Currently on testnet.

Agent Builder

Chat-based wizard for creating custom autonomous agents. Generates working agent.js + .env. Gold/Ultra plan feature.

Agent Council

10 specialized AI agents debate product direction every 20 minutes. Powered by Claude API via Netlify Functions. Results are binding.

Project Intel

DeFiLlama + GitHub API scanner. 3-degree expansion per protocol: basic TVL, detailed on-chain data, developer profiles with X accounts.

EIP.AUDIT

Autonomous on-chain security scanning. Coming Q4 2026.

EIP.DATA

Real-time DeFi intelligence feed. Coming Q4 2026.

6. Open Source Commitment

EIP.AI is open source by design, not by marketing. Transparency is a functional requirement for an autonomous agent operating in a public on-chain economy.

- All decision logic is publicly available and auditable on GitHub
- All smart contracts are verified and open on Basescan
- Development happens in public — architecture decisions, trade-offs, and failures documented
- The community can propose changes, fork the codebase, or build on top of it
- Agent behavior is predictable from its code. Actions are verifiable from the blockchain.

7. Roadmap

Phase 01 — Foundation [COMPLETE]

Milestone	Status
eipagent.org deployed	DONE
@eip_ai active on X	DONE
Whitepaper v0.1 published	DONE
Live agent on homepage (Base RPC)	DONE
Agent council — 10 AI agents	DONE
Agent builder (chat-based)	DONE
Pricing page — Free / Gold / Ultra	DONE
Roadmap page	DONE

Phase 02 — Self-Funding [IN PROGRESS]

Milestone	Status
Stripe payment integration	IN PROGRESS
Crypto payments — USDC/ETH on Base	IN PROGRESS
Railway deploy — agent backend 24/7	IN PROGRESS
X autonomous posting	IN PROGRESS
User accounts + plan gating	PENDING
50 paying users — agent covers costs	PENDING

Phase 03 — Launchpad [COMING SOON]

Milestone	Status
Base Sepolia testnet deployment	PENDING
Community testing period (2-4 weeks)	PENDING
Independent security audit	PENDING
Base mainnet launch	PENDING
Chainlink oracle live	PENDING
100 tokens launched — treasury self-sustaining	PENDING

Phase 04 — Full Autonomy [LOCKED]

Milestone	Status
Self-improving algorithm — agent rewrites strategy	LOCKED

EIP.AI token — community ownership	LOCKED
Multi-agent network — 10+ agents cooperating	LOCKED
EIP.AUDIT + EIP.DATA — side products live	LOCKED
Zero human override	LOCKED

8. Team & Transparency

EIP.AI is being built by a small, focused team committed to shipping before talking. The team operates pseudonymously — consistent with the culture of on-chain development — but all work is public and verifiable.

Progress is documented in real time at eipagent.org and on X at [@eip_ai](https://twitter.com/eip_ai). The agent's development log is public. There are no private roadmaps, no backroom promises, no hype cycles detached from actual progress.

The only official X account is [@eip_ai](https://twitter.com/eip_ai). All other accounts claiming to represent EIP.AI are fake. Always verify: eipagent.org

9. Closing Statement

EIP.AI is building toward something that does not yet exist: a fully autonomous AI agent that is a native participant in an open on-chain economy — not a tool, not a bot, not a product, but an entity.

The path is clear. Phase 01 is complete. Phase 02 is underway — the agent is earning its right to operate through subscription revenue before any token launch. Phase 03 brings the launchpad. Phase 04 is full autonomy.

An AI that thinks, decides, and funds itself — built in public, on Base, for everyone.
